PREFACE

On September 9, 1974, NUS Corporation was selected by the Rio Blanco Oil Shale Project (RBOSP) and Limnetics, Incorporated to perform the Aquatic Baseline Data Accumulation Program for federal Oil Shale Tract C-a. On October 15, 1974, the aquatic sampling program was initiated; during March 1975, NUS submitted the initial quarterly data report covering the period October 1974 - January 1975. This report constitutes the second quarterly data report submitted to Limnetics, Incorporated. In addition to data from April 1975, the report includes those data from the December 1974 - January 1975 period which were not analyzed at the time the initial quarterly report was submitted. The intent of this report is to present the data accumulated and analyzed since the initial quarterly report. Only limited interpretation of the data has been incorporated with the data.

2.4 AQUATIC STUDIES

2.4.0 Introduction

2.4.0.1 Program Objectives

The Aquatic Baseline Data Accumulation Program is designed to incorporate the environmental studies described in the Federal Register, Volume 39, Number 230, Part 3, Oil Shale Lease Environmental Stipulations and in the Tract C-a Exploratory Plan of May 1974. The overall objective for the aquatic program is to characterize the existing aquatic ecological communities in the vicinity of Tract C-a. These baseline studies will inventory the aquatic habitats which may be affected by the development of oil shale on and around Tract C-a; and will allow determination of species composition, productivity, importance to man, and relative uniqueness of aquatic habitats and species. The aquatic baseline program includes the collection and analysis of field data and an on-going survey of pertinent literature. Since most of the streams on and near Tract C-a are intermittent and since most of the permanent aquatic ecosystems occur off tract, characterization of the permanent streams will be emphasized.

2.4.0.2 Sampling Locations

The sites of the various sampling stations have been chosen to represent the broadest possible range of aquatic habitats available. A total of 35 sampling stations has been established. Because emphasis in this aquatic program has been given to the permanent streams near Tract C-a, 18 of the stations are located on the White River and Yellow Creek (near its confluence with the White River). The locations of the aquatic sampling stations are depicted in Figure 2.4-1 (p. 2.4-2). The description of each of these locations, presented in detail in Section 2.4.1 of the April 1975 RBOSP Quarterly Report, will not be repeated here. For convenience and ease of discussion, the sampling stations will be treated according to their geographical locations in the following manner: stations near the headwater areas west of Tract C-a (Stations 1 - 5); stations on Tract C-a (Stations 6 - 18); stations on Yellow Creek (Stations 19 - 22); and stations on the White River (Stations 23 - 35).

2.4.0.3 Schedule

The original and revised schedules of events for the RBOSP Aquatic Baseline Data Accumulation Program are presented as Tables 2.4-1 and 2.4-2 (pp 2.4-3 and 2.4-4), respectively. (The original schedule for the aquatic program was revised in order to intensify sampling frequency during the period when biological activity is greatest.) The initial sampling was begun in October 1974; and sampling will continue, in accordance with the Revised Schedule, through August 1976. At each sampling location all physical, chemical, and biological samples are obtained on the same day. Appendix B-1-1 lists the dates on which samples were collected in December 1974 -

January 1975, while Appendix B-1-2 lists the sampling dates for April 1975. During both sampling periods discussed herein, physical conditions (dry or frozen streams or deep snow accumulations) hampered or prevented sample collection. During December 1974 - January 1975 samples were obtained at a total of 24 locations, whereas during April 1975 samples were collected at 27 locations.

2.4.0.5 Report Motif

In the following paragraphs the presentation of results obtained during the December - January sampling period (which were not included in RBOSP Progress Report-2) and during the April sampling period has been limited to a preliminary description of the data, and, in the case of the physical and chemical parameters, only a limited number of selected parameters are discussed. No formal data interpretations will be attempted until one year of aquatic baseline data has been accumulated.

2.4.1 Physical and Chemical Characteristics

2.4.1 Physical Measurements and Water Chemistry

2.4.1.1 Objectives

The objectives of this segment of the aquatic studies include the determination of certain physical characteristics of the streams at each sampling station and the correlation of these characteristics with the chemical and biological data collected. In addition, this segment of the studies provides for the determination of concentrations of certain chemicals which may be of particular biological significance and correlation of these chemical data with the physical and biological data collected at the same time.

2.4.1.2 Methods

Water Flow

Duplicate samples are collected for the analysis of certain chemical characteristics of particular biological importance. These characteristics include alkalinity, calcium, chloride, total hardness, magnesium, nitrate, nitrite, ammonia, Kjeldahl nitrogen, orthophosphate, total phosphate, potassium, dissolved silica, sodium, sulfate, dissolved organic carbon, total organic carbon, suspended solids, and total dissolved solids.

Table 2.4-3 (2.4-7) presents the analytical methods, limits of detection, and methods of preservation for the aforementioned analyses as well as for the sediment analyses discussed in Section 2.4.6. Since Progress Report-2, the method of preserving magnesium, potassium, silica, sodium, dissolved organic carbon, and total organic carbon has changed from the addition of HNO_3 to the addition of HCl.Except for the use of the specific ion electrode for ammonium and Kjeldahl nitrogen determination, the analytical methods given in Table 2.4-3 (p 2.4-7) are specified in the Federal Register, Volume 38, Number 199, of October 16, 1973.

2.4.1.3 Results

Detailed presentations of the physical and chemical data collected during the April 1975 sampling period are included in Appendices B-2-1 and B-3-1. A summary of selected parameters is presented below.

The physical and chemical data obtained from the White River (Stations 23 - 35) and Yellow Creek (Stations 19 - 22) during April are generally within the same ranges of concentration reported by the USGS (1971, 1972, 1973) and by Everhart and May (1973) (refer to section 2.4.0 of Progress Report-2 for their findings). The exceptions were the pH values in the White River (which were slightly higher than previously observed) and values for total alkalinity and sulfate in Yellow Creek (which were lower than the 1420 to 1460 mg/l total alkalinity and 554 to 570 mg/l sulfate found by Everhart and May during the April - May period of 1969). The high turbidity values

Table 2.4-3. Water chemistry, Analytical Laboratory Methodology. RBOSP Aquatic Baseline Studies.

Parameter	Measurement Methodology[1]	Detection Limit (ppm)[2]	Sample Preservation
Alkalinity, total	Colorimetric	2	None required
Ammonia nitrogen	Electrode	0.10	$HgCl_2$
Calcium, dissolved	Atomic absorption	0.02	None required
Chloride, dissolved	Potentiometric	0.4	None required
Hardness, total	EDTA Titration	2	None required
Magnesium, dissolved	Atomic absorption	0.005	HCl

Phosphate, total	Same as orthophosphate	0.01	$HgCl_2$
Potassium, dissolved	Atomic absorption	0.01	HCl
Silica, dissolved	Molybdosilicate	0.005	HCl
Sodium, dissolved	Atomic absorption	0.005	HCl
Sulfate, dissolved	Gravimetric	0.30	Refrigeration
Carbon, dissolved organic	Beckman TOC Analyzer	2	HCl
Carbon, total organic	Beckman TOC Analyzer	2	HCl
Solids, suspended	Filtration	1	None required
Solids, total dissolved	Filtration and evaporation	1	None required
	SEDIMENT CHEMISTRY[3]		
Arsenic	Extraction and Atomic absorption	1.	Refrigeration
Aluminum	Extraction and Atomic absorption	10	Refrigeration
Herbicide	Gas Chromatography	100ppb	Refrigeration
Lead	Extraction and Atomic absorption	0.5	Refrigeration
Mercury	Extraction and Atomic absorption	0.02	Refrigeration
Nitrogen, total Kjeldahl	Kjeldahl digestion - Electrode	10	Refrigeration
Phosphate, total	Persulfate digestion	0.25	Refrigeration
Solids, total volatile	Filtration, evaporation volatilization	10	Refrigeration
Zinc	Extraction and Atomic absorption	0.5	Refrigeration

[1]Methods are those specified in the Federal Register, Vol. 38, No. 199, Oct. 16, 1973 except for use of specific ion electrode.

[2]For water samples, this detection limit is the minimum concentration which will be reported on natural and treated water samples (99.99% H_2O) with the indicated method and using a sample of defined size.

[3]Detection limits vary with sample size

during April 1975 were undobtedly a result of spring run-off. Dissolved oxygen concentrations remained high during this period of cold temperatures and increased flow. The ranges of chemical characteristics as observed during April are as follows:

	White River	Yellow Creek
Specific conductance (micromhos)	630 - 850	2500 - 3700
pH	8.2 - 8.5	8.5 - 8.6
Alkalinity, total $CaCO_3$ (mg/l)	169 - 211	707 - 1306
Chloride (mg/l)	24 - 39	26 - 110
Sulfate (mg/l)	48 - 71	194 - 291
Dissolved solids (mg/l)	453 - 644	2000 - 2500
Turbidity (JTU)	42 - 110	65 - 86
Dissolved oxygen (mg/l)	8.3 - 10.1	7.9 - 11.4
Temperature (^oC)	10 - 15	10 - 14

RBOSP PROGRESS REPORT

2.4.2 Phytoplankton

2.4.2 Phytoplankton

2.4.2.1 Objectives

The object of this aspect of the RBOSP aquatic studies is to determine composition and abundance of phytoplankton at each aquatic sampling location. Phytoplankton studies will aid in characterizing the aquatic habitats on and near Tract C-a.

2.4.2.2 Methods

No change in methods has occurred since Progress Report-2. See section 2.4.2.2 of Progress Report-2 for specific methods used in phytoplankton studies.

2.4.2.3 Results

Phytoplankton species observed in the December 1974 - January 1975 collections are listed in Appendix B-4-1. The results from the laboratory analysis of the second replicate of December 1974 - January 1975 phytoplankton are presented in Appendix B-4-2 (results from the first replicate were reported in Appendices A-5-1 and A-5-2 of Progress Report-2). A total of 99 algal taxa was observed in the December - January collections (both replicates).

As a result of additional taxonomic study of the October - November 1974 and December - January phytoplankton, the following revisions in nomenclature have been made: organisms reported previously as Chrysidiastrum catenatum will be reported as Chrysidiastrum ocellatum; organisms reported previously as Rivularia sp. will be reported as Calothrix sp.; and organisms reported previously as Stephanodiscus tenuis will be reported as Thalassiosira fluviatilis.

During the December - January period, the diatoms were generally the most abundant algal group at all locations sampled. Analyses of all December - January samples indicate that at the headwater stations phytoplankton abundance was generally low and the most abundant organisms were diatoms. The most abundant species at these stations included Achnanthes minutissima, Navicula salinarum, and Nitzschia linearis,. At tract Stations 5 and 14, phytoplankton abundance was quite low. At tract Stations 8 and 9,, the most abundant species was Chrysidiastrum ocellatum (a species belonging to the Chrysophyceae), while diatoms were the most abundant organisms at other stations. The most abundant species included Chrysidiastrum ocellatum, Achnanthes minutissima and Navicula salinarum. Diatoms were the most abundant organisms at the Yellow Creek stations. The most abundant species in Yellow Creek included Cymbella affinis, Cyclotella meneghiniana, and Navicula salinarum. Phytoplankton abundance was much lower at Station 19 than at any of the other Yellow Creek sites. This low plankton density is probably related to stream velocity. Samples were taken at the outflow of a spring where low densities would be expected. In the White River, diatoms were the most abundant phytoplankton group and the most abundant species

was Diatoma vulgare. Other abundant species included Cymbella affinis, Synedra ulna, Nitzschia frustulum, and Gomphonema ventricosa. The results of the analysis of one replicate of the April 1975 phytoplankton collection are presented in Appendices B-5-1 and B-5-2.

To date a total of 123 algal taxa has been observed in the April collection. At most headwater stations, the diatom Achnanthes minutissima and an unidentified flagellate were generally abundant. At the tract stations, Achnanthes minutissima and an unidentified chlorophyte were moderately abundant. At Stations 9, Chrysidiastrum ocellatum was very abundant. Based on the data analyzed to date, phytoplankton density at Station 14 (a small pond area) was much greater than at the other tract stations during April. In Yellow Creek, phytoplankton species composition and abundance at Station 19 was somewhat different from that found at Stations 20 and 22 and the phytoplankton density at Station 21 was quite low. The most abundant taxa in Yellow Creek included: Surirella ovata, Cyclotella meneghiniana, Navicula pelliculosa, Rhodomonas minuta, and an unidentified chlorophyte. In the White River, the diatoms Navicula viridula and Thalassiosira fluviatilis were abundant at all stations. At Station 33, more Cyanophyta (blue-green algae) were observed than at other stations. At Station 31, the diatom Gomphonema ventricosum was very abundant.

APPENDIX B-4-1

ALGAL TAXA OBSERVED IN THE PHYTOPLANKTON DURING
RBOSP AQUATIC BASELINE STUDIES
DECEMBER 1974 - JANUARY 1975

APPENDIX B-4-1

ALGAL TAXA OBSDRVED IN THL PHYTOPLANKTON DURING
RBOSP AQUATIC BASELINE STUDIES, DECEMBER 1974 - JANUARY 1975

CYANOPHYTA

Anabaena sp.

2.4.2.106

2.4.3 Zooplankton

2.4.3 Zooplankton

2.4.3.1 Objectives

The objectives of this aspect of the aquatic program are to determine the species composition and abundance of zooplankton at each aquatic sampling location.

2.4.3.2 Methods

No change in methods has occurred since Progress Report-2. See section 2.4.3.2 of Progress Report 2 for specific methods used in zooplankton studies.

2.4.3.3 Results

Zooplankton taxa encountered in December 1974 - January 1975 collections are listed in Appendix B-6-1. The results of the analysis of the second replicate of zooplankton collected during December 1974 - January 1975 are presented in Appendix B-6-2 (results from the first replicate were reported in Appendices A-7-1 and A-7-2 of Progress Report-2). A total of 50 zooplankton taxa was observed in the December 1974 - January 1975 collections (both replicates). As a result of further taxonomic study, organisms which were previously reported as Alona rectangula will now be reported as Alona sp. At the headwater stations, the most abundant taxa in December - January included the protozoans Centropyxis aculeata and C. constricta and bdelloid rotifers. At the tract stations, the most abundant taxa included the protozoans Centropyxis aculeata and Vorticella sp; the rotifers Colurella spp. Notholca acuminata, N. squamula, Monostyla sp., and M. closterocerca; and crustacean nauplii and Bryocamptus hiemalis. At the Yellow Creek stations, the most abundant taxa included the protozoans Centropyxis aculeata, and C. constricta; the rotifers Monostyla sp., M. closterocerca, and Notholca acuminata; and ostracods. Zooplankton abundance was much lower at Station 19 than at any of the other Yellow Creek stations. The samples from Station 19 were collected at the outflow of a spring. Zooplankton densities at the White River stations were generally greater than those found in other study areas. The most abundant taxa in the White River included the protozoans Centropyxis aculeata and Vorticella sp.; and the rotifer Proales sp.

In the analysis of one replicate from the zooplankton collections of April 1975, a total of 39 species has been observed. The list of zooplankton species observed to date in the April collections is presented in Appendix B-7-1. Quantitative data from one replicate are presented in Appendix B-7-2. Analysis of the one replicate indicates that at the headwater stations above Tract C-a the most abundant taxa were Centropyxis aculeata, Epistylis sp., bdelloid rotifers, unidentified rotifer species (contracted), and crustacean nauplii. At the tract stations, the most abundant taxa included Centropyxis aculeata, Vorticella sp., bdelloid rotifers, and Notholca squamula. At the Yellow Creek stations, the most

abundant taxa were Centropyxis aculeata, Difflugia acuminata, Notholca acuminata, and bdelloid rotifers. At the White River stations, Centropyxis aculeata, Chilodonella spp., Epistylis sp., Vorticella sp., bdelloid rotifers, Notholca squamula, Proales sp., and unidentified rotifer species (contracted) were the most abundant taxa.

RBOSP PROGRESS REPORT

2.4.4 Periphyton

2.4.4 Periphyton

2.4.4.1 Objectives

The objective of this aspect of the aquatic studies is to describe the algal component of the periphyton community at each station, including the composition, abundance, and diversity of that component.

2.4.4.2 Methods

The methods reported in section 2.4.4.2 of Progress Report-2 remain unchanged, with the exception that, in the laboratory, each preserved periphyton sample was diluted to a constant volume of 100 ml rather than 130 ml.

2.4.4.3 Results

Appendix B-8-1 lists the algal taxa encountered in the December 1974 - January 1975 periphyton collections. The results of the analysis of the third replicate of periphyton collected during December 1974 - January 1975 are presented in Appendix B-8-2 (results from the other two replicates were reported in Appendices A-9-1 and A-9-2 of Progress Report-2). A total of seventy-nine algal taxa was observed in the December 1974 - January 1975 collections. As a result of additional taxonomic study, taxa previously reported as Rivularia sp. and Stephanodiscus tenuis will now be reported as Calothrix sp. and Thalassiosira fluviatilis, respectively. Based upon the results from the three replicate samples taken at each station, the most abundant algae in the periphyton of the headwater stations during December - January were the diatoms Achnanthes lanceolata, A. minutissima, Gomphonema intricatum, Nitzschia frustulum, and N. linearis (Achnanthes minutissima was particularly abundant at Station 4). At the tract stations, the most abundant species were the diatoms Achnanthes minutissima, Cymbella affinis, Navicula cryptocephala, Nitzschia denticula, and Synedra amphicephala. Alga densities were quite low at Stations 8 and 9, whereas densities of Achnanthes minutissima were very high at Station 14. In Yellow Creek, the most abundant species at Station 19 were the diatoms Navicula cryptocephala, N. viridula, Nitzschia frustulum, N. palea, Surirella ovata, and Synedra amphicephala. In the White River, densities were generally high and the diatoms Diatoma vulgare, Epithemia sorex, and Navicula cryptocephala were particularly abundant. Several species of Cyanophyta (blue-greens), including Calothrix sp. and Lyngbya sp., were also quite abundant.

During the analysis of one replicate from the periphyton collections made during April 1975, a total of 64 taxa was encountered. Appendix B-9-1 lists the algal taxa observed in the initial replicate and Appendix B-9-2 presents the quantitative data from that replicate. At the headwater stations, the most abundant species included the diatoms Achnanthes minutissima, Gomphonema intricatum, Meridion circulare, Surirella ovata, and Synedra amphicephala. At the tract stations, the blue-green alga Plectonema sp.

and the diatoms Achnanthes minutissima, Gomphonema intricatum, Nitzschia denticula, and N. frustulum were the most abundant taxa. In Yellow Creek, the most abundant species were the diatoms Achnanthes minutissima, Fragilaria vaucheriae, Navicula pelliculosa, and Surirella ovata. In the White River the blue-green species Calothrix sp. and the diatoms Epithemia sorex, Navicula cryptocephala, N. tripunctata, N. viridula, Nitzschia dissipata, and Gomphonema olivaceum were most abundant.

APPENDIX B-8-1

ALGAL TAXA OBSERVED IN THE PERIPHYTON DURING
RBOSP AQUATIC BASELINE STUDIES
DECEMBER 1974 - JANUARY 1975

APPENDIX B-8-1

ALGAL TAXA OBSERVED IN THE PERIPHYTON DURING
RBOSP AQUATIC BASELINE STUDIES, DECEMBER 1974 - JANUARY 1975

RBOSP PROGRAM SUPPORT

2.4.5 Benthos

2.4.5 Benthos

2.4.5.1 Objectives

The objective of this aspect of the aquatic baseline data accumulation program is to describe the benthic community and its diversity in each sampling area and to visually examine and describe stream substrates in those areas.

2.4.5,2 Methods

The methods reported in section 2.4.5.2 of Progress Report 2 remain unchanged, with the exception that the D-frame net was not utilized during the April sampling. Instead, a modified Surber sampler which is 25 inches high was utilized in deeper areas of the White River. In addition, in several of the very narrow streams on or near Tract C-a, an elliptical modified Surber sampler was used to collect the April benthos samples.

2.4.5.3 Results

Appendix B-10-1 and B-10-2 include the results of the analysis of Chironomidae and Oligochaeta collected during December 1974 - January 1975. A total of 10 taxa of Oligochaeta and 35 taxa of Chironomidae were observed. The total number of taxa (including all taxonomic groups) identified in benthos samples taken during December - January is 108. Further taxonomic study of both the October - November and December - January benthos has resulted in the following revisions in classification of organisms: taxa previously reported as Neotrichia (Trichoptera:Hydroptilidae) will now be reported as Glossosomatidae (Trichoptera); the following revisions have been made to Chironomidae reported for the October - November period: Chaetocladius sp., Parakiefferiella sp. 2, Orthocladiinae sp. 2, and Orthocladiinae sp. 3 and 4 will now be reported as Parametriocnemus - Paraphaenocladius, Paracladius Cardiocladius, and Orthocladiinae sp. 1, respectively. In addition, the following have been added to the list of taxa observed during October - November: Cricotopus (Cricotopus) festivellus group, Cricotopus (Cricotopus) trifascia, Cricotopus (Isocladius) c.f. tricinctus, Parametriocnemus sp., and Paraphaenocladius sp., (all of these taxa belong to the family Chironomidae).

During the analysis of one replicate of the benthos samples collected during April 1975, a total of 45 taxa have been observed. Appendix B-11-1 lists the taxa observed in April samples to date. Appendix B-12-2 presents the quantitative data from laboratory analyses completed to date. At the headwater stations the most abundant taxa included Chironomidae, Nematoda, Oligochaeta, Baetidae, Ceratopogonidae, and Simuliidae. At the tract stations taxa belonging to the Chironomidae, Baetidae, and Oligochaeta were most abundant. In Yellow Creek the most abundant taxa belonged to the Oligochaeta, Ceratopogonidae, Chironomidae, and Simuliidae. In the White Riverthe most abundant taxa belonged to the Chironomidae, Ephemerellidae, Tricorythidae, and Oligochaeta.

RBOSP PROGRESS REPORT

2. 4. 6 Sediment Chemistry

2.4.6 Sediment Chemistry

2.4.6.1 Objectives

The objectives of sediment chemistry studies remain the same as those stated in section 2.4.6.1 of Progress Report-2.

2.4.6.2 Methods

As indicated in Table 2.4-3, refrigeration is used to preserve sediment samples. Since Progress Report-2, the analytical methods utilized for total Kjeldahl nitrogen and total phosphate have been changed to Kjeldahl digestion and electrode and persulfate digestion, respectively; and sediment detection limits have been updated.

2.4.6.3 Results

Appendix B-12-1 includes the results of chemical analysis of sediment samples taken during the April 1975 sampling period. Appendix B-13-1 includes the results of analysis for selected herbicides in the same sediment samples.

RBOSP PROGRESS REPORT

2.4.7 Macrophytes

2.4.7.1 Objectives

The objectives of this aspect of the aquatic studies are to identify and enumerate the aquatic macrophyte species at each sampling station, to determine their relative abundance, and to estimate the percentage of substrate area covered by major beds of macrophytes.

2.4.7.2 Methods

No change in methods has occurred since Progress Report 2. See section 2.4.7.2 for specific methods used in aquatic macrophyte studies.

2.4.7.3 Results

Aquatic macrophytes were observed at a single sampling location during the April 1975 sampling period. At Station 2, water cress (Rorippa nasturtium - aquaticum) was found in scattered abundance. This rating of relative abundance conforms to the system of Jessen and Lound (1962). At the macrophyte sampling transect at Station 2, water cress covered an area of 162.6 cm^2. Within 15.2m(50 ft) of the sampling transect, water cress was found to cover areas of 284 cm^2 and 853 cm^2.

2.4.8 Fish

2.4.8 Fish

2.4.8.1 Objectives

The objectives of fish studies remain the same as those stated in section 2.4.8 of Progress Report 2.

2.4.8.2 Methods

No change in methods has occurred since Progress Report 2. See section 2.4.8.2 of Progress Report 2 for specific methods employed in fish studies.

2.4.8.3 Results

The mean condition factors presented in Appendix A-14-2 of Progress Report-2 should be revised as follows: Mottled sculpin - 1.4; Flannelmouth sucker - 0.86; and Mountain whitefish - 0.92. Fish data from the April sampling period are presented in Appendices B-14-1 through B-14-11. During April, approximately 148 fish, representing 10 species and one hybrid were captured in the White River and lower Yellow Creek. The major portion of the catch during April was composed of flannelmouth and bluehead sucker, mottled sculpin, longnose dace, and fathead minnow. The catch was dominated by rough and forabe fishes; few game fish were observed, although a small number of rainbow trout, brown trout, and mountain whitefish were found in the White River. High turbidity and discharge interfered with fishing efforts during April, as suggested by the relatively few specimens of mottled sculpin captured.
